Step-by-Step Connection Guide

This guide explains how to make your **Client Portfolio** and **Owner Dashboard** talk to each other using Firebase.

1. The Project Structure

In your VS Code project folder (e.g., `dondeal-portfolio`), your `src` folder should look like this:

- `src/App.jsx` (The Client Portfolio)
- `src/OwnerDashboard.jsx` (The Owner Side)
- `src/main.jsx` (The "Switchboard" that tells React which file to show)

2. The "Bridge" (Firebase Config)

Both files need to share the exact same **Firebase Configuration**. This is the "ID card" that tells the database they belong to the same business.

In both files, look for this block:

```
const firebaseConfig = {
  apiKey: "...",
  authDomain: "...",
  projectId: "...",
  // ... rest of your config
};
```

Crucial: If you are using a real Firebase project, ensure the `apiKey` and `projectId` are identical in both files.

3. Install the "Tools"

Open your terminal in VS Code and run this command once. This installs the "pipes" that move the data:

```
npm install firebase framer-motion
```

4. How to Switch Between Views

Since you are running this locally, you need to tell React which page to show on your screen. Open `src/main.jsx`.

To see what the CLIENT sees:

```
import App from './App.jsx' // Points to the Portfolio
```

To see what YOU (the Owner) see:

```
import App from './OwnerDashboard.jsx' // Points to your Dashboard
```

Simply change the import line and save. The browser will refresh automatically.

5. The "Magic" Moment (Testing)

1. Set `main.jsx` to show **App.jsx** (Client Side).
2. Open your website in your browser.
3. Fill out the contact form and click **Transmit**.
4. Now, go back to VS Code and change `main.jsx` to show **OwnerDashboard.jsx**.
5. Save and look at your browser. The message you just sent will be sitting there in your "Lead Stream"!

Summary of the Flow

1. **Client** fills form in `App.jsx`.
2. `App.jsx` sends that data to **Firebase Cloud**.
3. **Firebase** stores it in a folder named after your `appId`.
4. `OwnerDashboard.jsx` is constantly "listening" to that same folder.
5. The moment data arrives, the Dashboard updates your screen.
